

Type of process	Description of the invention	Findings of the patent	Patent number	Publication date	Ref.
<b>Extrusion</b>	Twin screw extrusion of lignocellulosic biomass (preferred wood chips or sawdust) by prior to enzymatic hydrolysis to produce ethanol.	Significant increase in sugar recovery from such biomass.	US2006141584	2006-06-29	[25]
	Natural fiber hydrolytic reactor to treat plant cellulose and hemicellulose mixed with starch or raw materials to prepare a sugar solution.	No further additive needed. Environmental-friendly process, simple control and reduced manufacturing cost.	CN101418353	2009-04-29	[26]
<b>Reactive extrusion</b>	Extrusion of lignocellulosic material at 60-180°C with 200-450% water plus 0.5-4% strong acid or base for ethanol production.	Fibrillation of the material. 8 fold increase of the enzymatic hydrolysis yield.	WO2010063980	2010-06-10	[30]
<b>Alkaline extrusion</b>	Twin-screw extrusion of lignocellulosic biomass in a with an alkaline solution (NaOH and/or Na <sub>2</sub> S) 3 to 30% weight at 60- 230°C, prior to enzymatic hydrolysis.	Good contact biomass/alkaline solution, continuous pretreatment, short time, low heat required.	US4642287	1987-02-10	[22]
<b>Acid hydrolysis and extrusion</b>	Extruder device composed of two chambers separated by a pressure sensitive die. In the extrusion zone, materials are pretreated at high pressure and temperature, and then pass into a reaction zone where they are mixed with an acidic solution at lower pressure and temperature.	Improved low cost energy efficient extrusion device, unique die construction that avoids surging and blowing of the fibrous materials, minimum acid degradation of the extruder components.	US4728367	1988-03-01	[24]

<b>Steam explosion and extrusion</b>	Pretreatment process of lignocellulosic biomass with multiple applications (ruminant feed, conversion to sugars and alcohols, lignin extraction) consisting in a treatment with steam at high pressure to raise temperature (185-240°C) in a short time, followed by the release of the pressure by extrusion through a die.	Severe mechanical destructure of lignocellulosic materials, minimization of hemicellulose degradation, enhanced enzymatic digestibility.	CA1217765	1987-02-10	[23]
	Pretreatment of lignocellulosic biomass in two steps with intermediate filtration. In which step two is carried out in a similar steam explosion-extrusion reactor as in the example above.	Improvement of the process referred above. Sequential hydrolysis of the material that allows removing hemicelluloses and possible inhibitors after the first pretreatment stage.	CA2842781	2013-01-31	[32]
<b>Ammonia fiber explosion and extrusion</b>	Extrusion process of cellulosic material with ammonia to expand the fiber to use it for animal feed or nutrient source for fermentation.	Increased enzymatic and ruminant digestibility, reduction in apparent lignin, high rate of digestion.	WO9956555	1999-11-11	[31]
<b>Extrusion and microwave treatment</b>	Extrusion process on wet lignocellulosic biomass for producing biogas or bioethanol, consisting in a single or twin-screw machine coupled to a microwave process at high temperature (150-250°C) and pressure where thermal and possibly chemical hydrolysis (if catalyst is added) takes place, followed by anaerobic fermentation.	For biogas production, the dry fermentation process time is reduced to 10-20 days and biomass utilization increases up to 65-80% dry weight basis. For bioethanol, sugar yields increase to 75-85% of polysaccharides in the dry biomass, inhibitory products furfural and HMF remain in low concentrations and final ethanol yields increase.	EP1978086	2008-10-08	[29]
<b>Vacuum extrusion</b>	Pretreatment to produce bioethanol or other	Increase in at least 19% ethanol	EP2226387	2010-09-08	[27]

	valuable products from biomass, consisting in a vacuum extrusion (-3 kPa or more).	production compared to material not subjected to vacuum extrusion.			
<b>Bioextrusion</b>	Mechano-chemical treatment for the production of sugars from lignocellulosic biomass (to ethanol production) comprising consecutive steps of introduction of an alkaline extrusion, neutralization, filtration, and addition of enzyme solution into the extruder.	Reduced treatment time, low or no production of inhibitors for the enzymatic hydrolysis and fermentation, method easy to implement in pre-existing industrial installations.	US2015299751	2015-10-22	[28]
